

ABSTRACT OF THE DISCLOSURE

A dispenser to dispense towels selectively treated with a fluid, includes a compartment having an open upper end and containing at least one dispensable towel therein. A removable cover is disposable on the compartment to form an enclosure with the compartment. A towel dispensing conduit extends through the cover to a top opening of the cover, the conduit defining a path through which the dispensable towel is extracted from the compartment and dispensed from the top opening of the cover. A fluid application assembly is associated with the removable cover. The fluid application assembly includes a fluid reservoir, oriented over the compartment when the cover is disposed on the compartment, and being configured to receive and store the fluid therein; and a fluid applicator, in fluid communication with the reservoir and being selectively operable by a user to selectively apply the fluid to the dispensable towel as the towel is dispensed from the dispenser.
